

Converting between dB and Hex Values when Programming the QF1Da512 Gain Registers

1) Introduction

The QF1Da512 SavFIRe is an enhanced version of the QF1D512 SavFIRe, offering several new features. One such feature is the integration of a dedicated digital gain stage after the FIR computation function. The gain value applied to the data samples is defined by two configuration registers in the QF1Da512.

2) Gain Registers

The two registers used for the gain are located at offsets 0x0F and 0x10, with 0x10 being the MSB and 0x0F being the LSB. The LSB is concatenated to the MSB to create a 16-bit value. This value is unsigned with 4 integer bits and 12 fractional bits (u4.12). The operation applied to the samples is a linear multiply. The range is decimal 0 to just under 16. The format is described in more detail in the QF1Da512 datasheet.

3) dB to Linear Gain Table

The dB scale is often preferred over a linear gain scale when referring to audio loudness levels. Below is a table of linear gain values that can be written to the registers, with values listed in 1 dB steps. You can also enter more precise values (i.e. -16.25 db). However, this table gives a good example of values that are typically used for volume control.

Please feel free to contact Quickfilter if you need assistance determining the linear value that corresponds to a specific dB value.
